Instruction for use
Plunger Probes
M5678-78FB and
M78-Plus
DIATEST Plunger Probe M5678 - 68FB

Self-centering interior measuring gauge for bore diameter from 19,5 to 330 mm

Design
A plunger probe consists of following components:
- Plunger probe (1) with carbide measuring contact; carbide anvils
- HMT (3) extension (if necessary); ZS (2) indicator holder (5) with thread connection M6x0,75; display (4); setting master or setting device

Design
Standard Plunger Probes
Plunger probes for measuring range 19,5mm to 330mm are manufactured in 4 different sizes (MK5, MK6, MK7 and MK8). They are equipped with a centering bridge.

Blind bore style
These plunger probes correspond in their function and design to standard plunger probes. Measuring contact, carbide anvil and centering shoe are designed in a manner that enables measuring at a distance of 1,6mm from the bore base. Plunger probes for the range 38,5 – 348mm are supplied in 2 different designs (MK6-FB and MK8-FB).

Mode of Operation
Plunger probe with extension and anvil is selected according to the table (see pages 4-8) and is screwed into a holder with a display unit. During the gauging operation spring-loaded centering bridge centres the gauge in the bore. Bore diameter is determined by a pendulum movement of instrument in the bore. Reversal point of display of measured value indicates deviation to the setting master.
Minimum value is recorded by oscillating in the bore with the help of digital dial indicator MDU-M. Bore diameter can be displayed either absolute or relative (to setting master).

**Calibration**
Plunger probes are comparative measuring instruments. A reference standard is therefore necessary for calibration. Calibration (zero setting) of instrument can be done in various ways according to level of accuracy required:
In the setting ring (highest accuracy). With a micrometer (not suitable for FB style). For the FB application, DIATEST developed a setting guide which is clamped on to the micrometer spindle. The centering disk (MZT) prevents plunger probe from slipping out during calibration. With setting devices, slip gauges etc.

**Transmission of measured displacement**
Measured displacement of measuring contact (6) is transmitted via a transfer lever (7) at the rate of 1:1 to transfer pin (8) and display.
Technical Data

- Operative range $\varnothing 19,5 - 330 \text{ mm} \ (\varnothing 38,5 - 348 \text{ mm with FB design})$
- Measuring range 3mm (MK-5; 2.5mm)
- Accuracy of standard design:
  Repeatability $\leq 0.001\text{mm}$
  Linearity: max: $0.006\text{mm}$ in measuring range
- Connection thread M6x0.75
- Measuring depth: easily up to 3m
- Carbide contact points
- Measuring contact radii R8.0
- Required measuring pressure of dial indicator: 1.5-2.0N

Maintenance

Due to the closed design DIATEST plunger probes are largely protected against dirt. If probe gets dirty it can be dismantled easily by unscrewing the parts. A suitable cleaning agent is sufficient for cleaning. After cleaning all parts must be lubricated with a thin, non-resin oil.
